# 1.0 EXECUTIVE SUMMARY

## 1.1. Project Overview

In April of 2022, IMS deployed a state-of-the-art Road Surface Tester (RST) (shown in **Figure 1**) to Bloomington (City) to capture continuous, high-resolution pavement cracking, rutting, and roughness data on 237 centerline miles of majority asphalt roadways. Collected data were entered into the Lucity pavement management system, and representative pavement condition scores were determined for each roadway segment. The Lucity pavement management system was used to develop multi-year pavement maintenance and rehabilitation (M&R) recommendations, which are included in this report.

The Pavement Condition Index (PCI) method was used in accordance with the American Society for Testing and Materials (ASTM) D6433 to assess the condition of the City’s pavements. Widely used in the industry, the PCI method is a standard, objective, and repeatable approach to assess pavement condition. Based on the PCI results, Lucity prioritizes funding using a cost-of-deferral approach, recommending M&R activities that optimize funding by selecting rehabilitation candidates only when they approach the critical point where a heavier maintenance activity will soon be needed to restore the roadway to full service.

The analysis and data presented in this report are based on the inspections performed by IMS in April 2022 on the City’s pavement network, using available work history and other assumptions that are elaborated on later in this report. The information presented in the Executive Summary is condensed from various sections of this report. It is essential that reviewers familiarize themselves with the detailed information provided in subsequent sections of this report prior to making any specific decisions based on these results.

**Figure 1 - IMS Road Surface Tester (RST)**

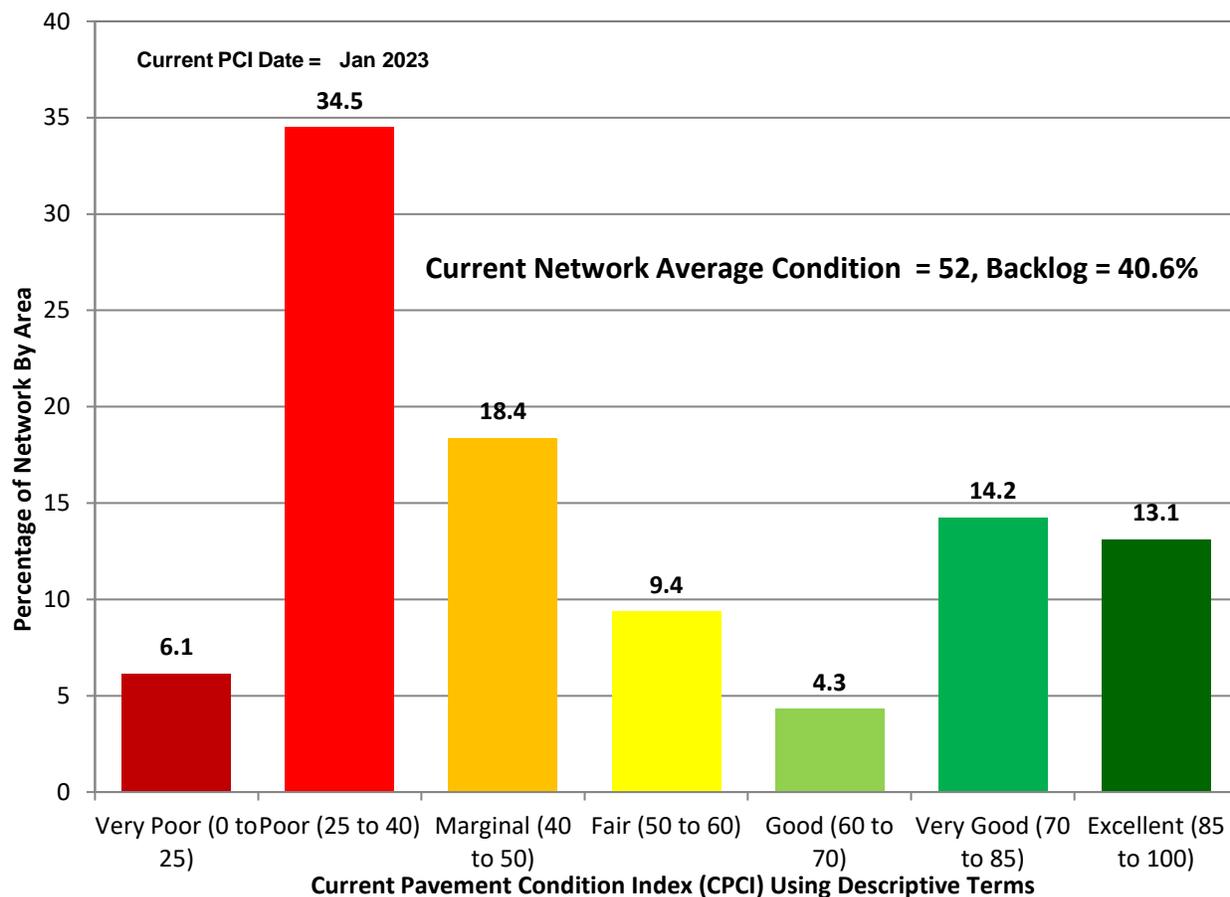

## 1.2. Results

PCI values provide an indication of the surface conditions and structural integrity of a pavement. The 0 to 100 PCI range is commonly divided into various categories using descriptive terms. Divisions between the terms are not fixed but are meant to reflect common perceptions of pavement conditions. **Table 1** shows the categories chosen to represent the City’s PCI assessment criteria, and it includes typical pavement distresses and M&R needs within each category.

**Table 1 - City of Bloomington’s pavement condition categories**

Category	Typical Distresses and M&R Recommendations	PCI Range
Excellent	Like new condition – little to no maintenance required  Monitor condition or preventive maintenance.	(85-100]
Very Good	Minor cracking, raveling, and other non-load associated distress  Routine or preventive maintenance. <i>E.g., Crack sealing, surface treatment</i>	(70-85]
Good	Minor to moderate cracking and low severity load associated distresses such as alligator cracking and rutting.  Surface treatments with localized repairs and overlays <i>E.g., Surface treatments, localized surface patching, thin overlay</i>	(60-70]
Fair	More extensive and severe longitudinal and transverse cracking, as well as moderate severity load associated distresses  Localized repairs or major rehabilitation. <i>E.g., Localized surface and/or full-depth patching, moderate overlays</i>	(50-60]
Marginal	Localized high-severity alligator cracking, and rutting.  Major rehabilitation. <i>E.g., Localized full-depth patching, mill and overlay, traditional overlay</i>	(40-50]
Poor	A greater extent of severe alligator cracking, rutting  Major rehabilitation. <i>E.g., More extensive full-depth patching, mill and overlay, traditional overlay</i>	(25-40]
Very Poor	Extensive and severe alligator cracking, more extensive and deeper rutting, and potholes.  Major rehabilitation. <i>E.g., Full-depth reclamation, reconstruction</i>	[0-25]

The City’s roadways were found to be in fair condition **with an average PCI of 52**. Approximately 27% of the City’s roadways were found to be in excellent or very good condition. These pavements are candidates for more cost-effective pavement preservation treatments. Pavements with a PCI below 40 (i.e., pavements in poor or very poor condition) comprise the City’s “backlog” of M&R. The **City’s backlog was found to be approximately 41%**. A breakdown of the condition distribution of the City’s pavement network is shown in **Figure 2**. Detailed information on pavement conditions can be found in section 3.

**Figure 2 - Pavement Condition Overview**

The following **Figure 3** demonstrates some of the funding models produced as a result of the Lucity analysis. The current budget is represented by the green line, while the steady state (funding needed to maintain current PCI) is presented by the red line.

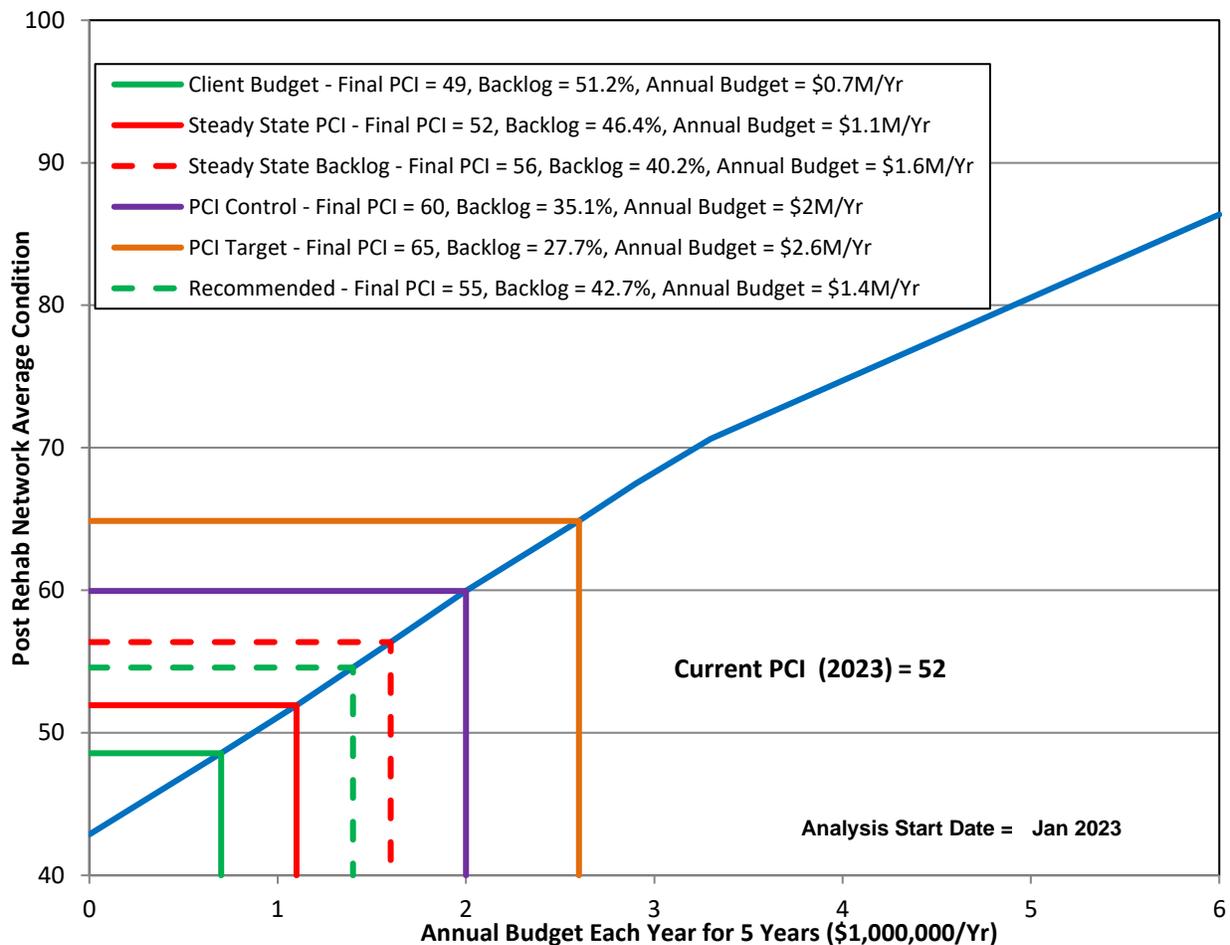

Figure 3 - Funding Models vs PCI in 5-years

### 1.3. Findings and Recommendations

For the City to get the most return on investment from the Lucity Pavement Management System, IMS presents the City with the following findings and recommendations:

- The City’s network-level PCI is 52, and the backlog represents 41% of the network.
- Reduce the backlog, thereby freeing up funds for inexpensive pavement preservation activities, such as microsurfacing.
- Focus on the restoration of roads in the “Marginal to Fair” PCI range through the use of strategic overlays.
- Concentrate rehabs on critical PCI candidates. Lucity recommendations produce optimal results when maintenance work is focused on roads that are at their “Critical PCI” point.
- Current \$700K/Yr. budget will result in a PCI of 49 and a backlog of 51% after the 5-year budget horizon. (Detailed funding projections are presented in section 4)

## 2.0 PRINCIPLES OF PAVEMENT MANAGEMENT

### 2.1. Foreword

This section covers the basics of pavement management, discussing its purpose of as well as best practices for M&R planning as they relate to the lifecycle of a pavement. It explains how these concepts interact within the Lucity pavement management system that was implemented and will provide context for the findings and recommendations within the report.

### 2.2. Pavement Management Principles

Pavement management is the process of assessing, prioritizing, and preserving or rehabilitating pavements through a logical system that attempts to use available funds in the most cost-effective manner possible. It is generally an iterative process that grows in accuracy as more data becomes available to better refine prediction models. **Figure 4** illustrates that, typically, pavements start deteriorating rapidly once they hit a specific threshold. A nominal investment in cheaper surface treatments at 40% lifespan is much more cost-effective than deferring maintenance until heavier overlays or possibly reconstruction is required just a few years later. Streets that are repaired while in good condition will have an extended lifetime and will cost less over their lifetime than those left to deteriorate to a poor condition. Without an adequate routine pavement maintenance program, streets will require more frequent reconstruction, thereby requiring significantly greater funding.

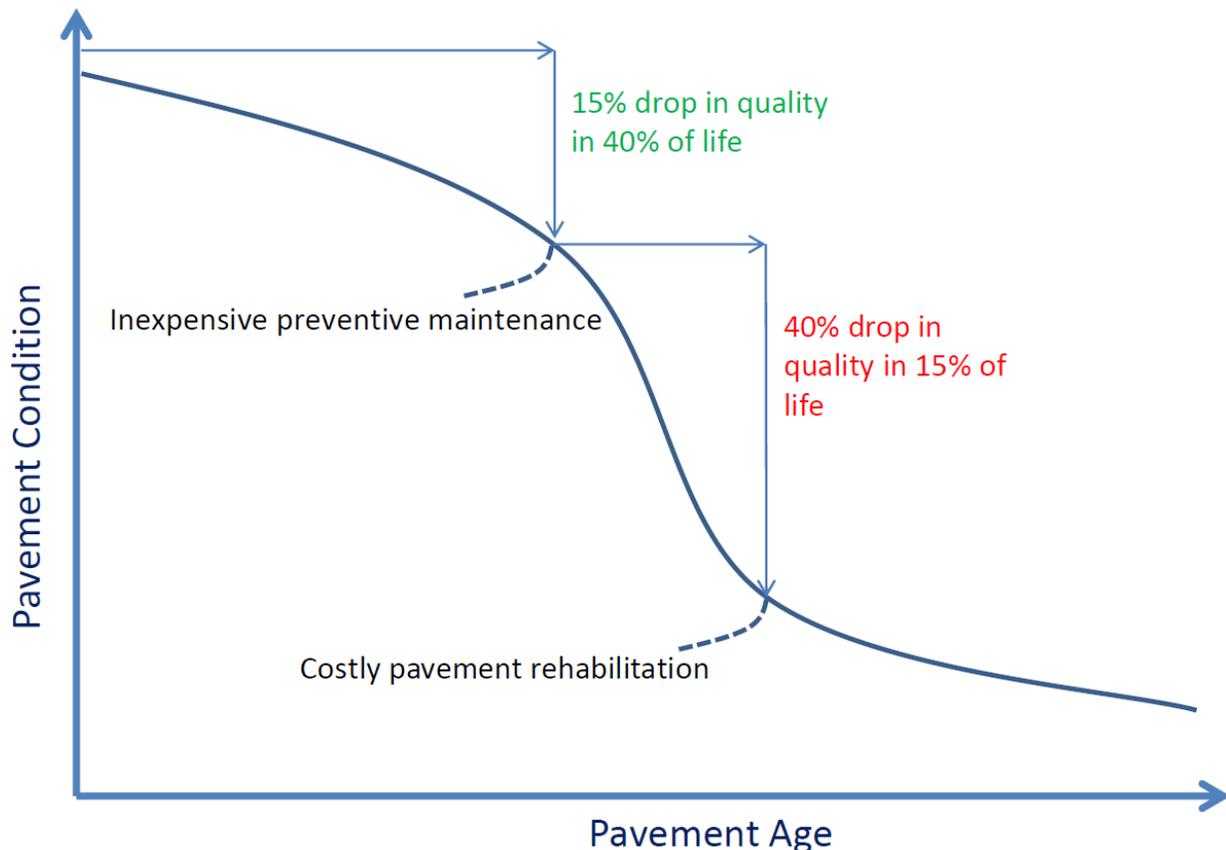

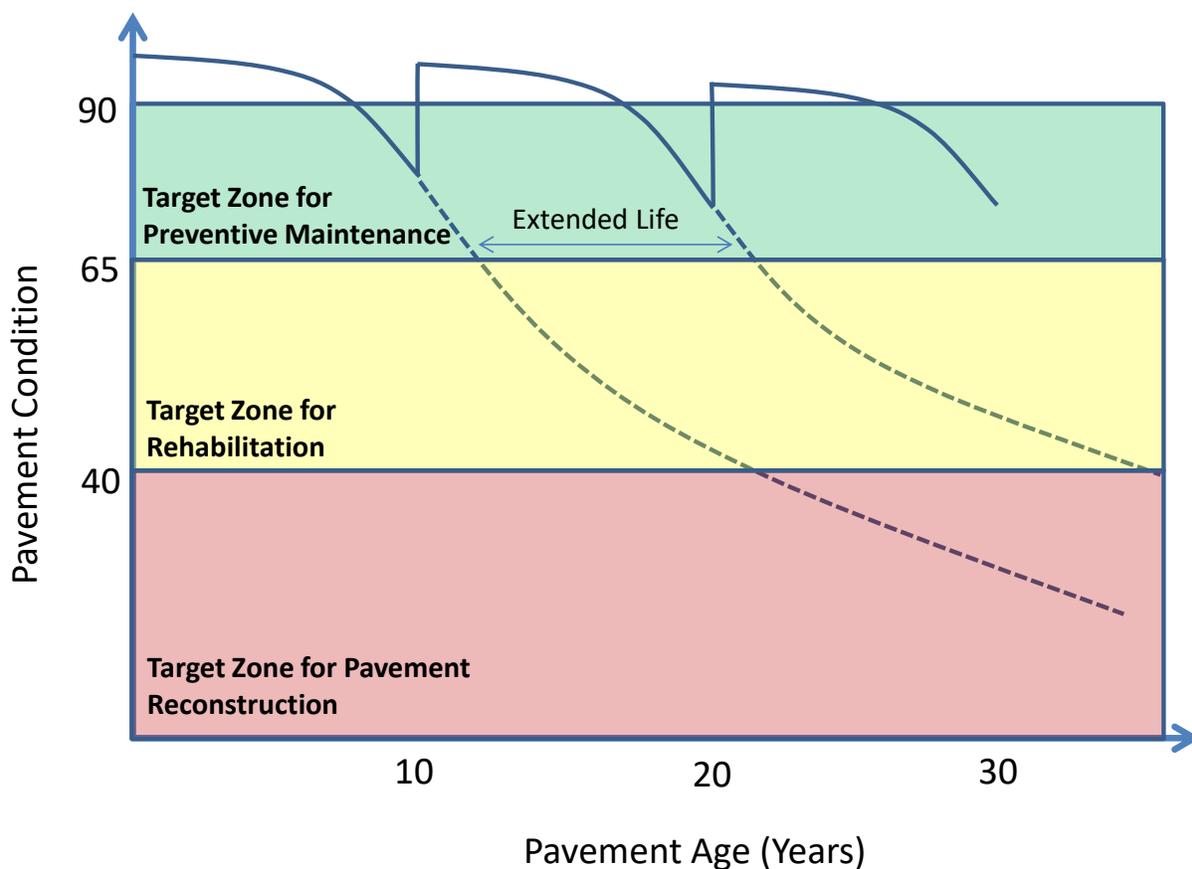

Figure 4 - Pavement Deterioration and Life Cycle Costs

The types of rehabilitation activities that the City chooses to deploy can have a significant effect on the longevity of a pavement. Depending on the zone in which a pavement falls, a detailed rehabilitation strategy set needs to be formed. Common rehabilitation types include Stop Gap, Rehabilitation, Reconstruction, and Preventive Maintenance. It is the proper incorporation and application of M&R activities within the Preventative Maintenance category that a pavement management program leverages. Popular examples of cost-effective preventive activities include:

- Crack and Joint Sealing
- Microsurfacing
- Rejuvenating agents
- Patching
- Fog, Slurry, and Chip Seals
- Thin Overlays

These activities help maintain and repair the surface integrity which can slow deterioration and depending on the treatment, also extend the life of a pavement. The outcome of this exercise is the long-term cost savings and an increase in network-level pavement quality over time. **Figure 5** illustrates the concept of extending pavement life through the application of timely M&R activities.

**Figure 5 - Pavement Life Cycle Curve**

The best method to obtain the most optimal usage of available funds or to determine the required funding to achieve a predetermined level of service is through the use of a pavement management system. An effective pavement management system can assist agencies in developing an organized catalog of pavement assets, store periodic condition assessments, track spending and costs, compare trends in data, and assess the effectiveness of maintenance activities and new technologies.

## 2.3. Pavement Management Program

The practical implementation of a pavement management program requires that an agency have an accurate understanding of the assets under its management. To fulfill this requirement IMS was contracted by Bloomington, IN to conduct a comprehensive pavement condition assessment and pavement management analysis on the City's roadway network.

## 2.4. Lucy Pavement Management System

The City primarily utilizes Lucy for its pavement management program. Lucy will allow the city to catalog, classify, assess, track, and analyze condition data to aid in the processes of budget planning and pavement rehabilitation.

More specifically the program will help the City through the process of pavement management by giving structure to the basic information required for a management system:

- Pavement Section Inventory
- Pavement Deterioration Modeling
- Prioritization
- Funding Analysis
- Inspection Data
- Rehabilitation Selections & History
- Work Planning
- Reporting

The following pages will briefly detail the reasoning behind why this information is collected and used within the management program.

### Pavement Section Inventory

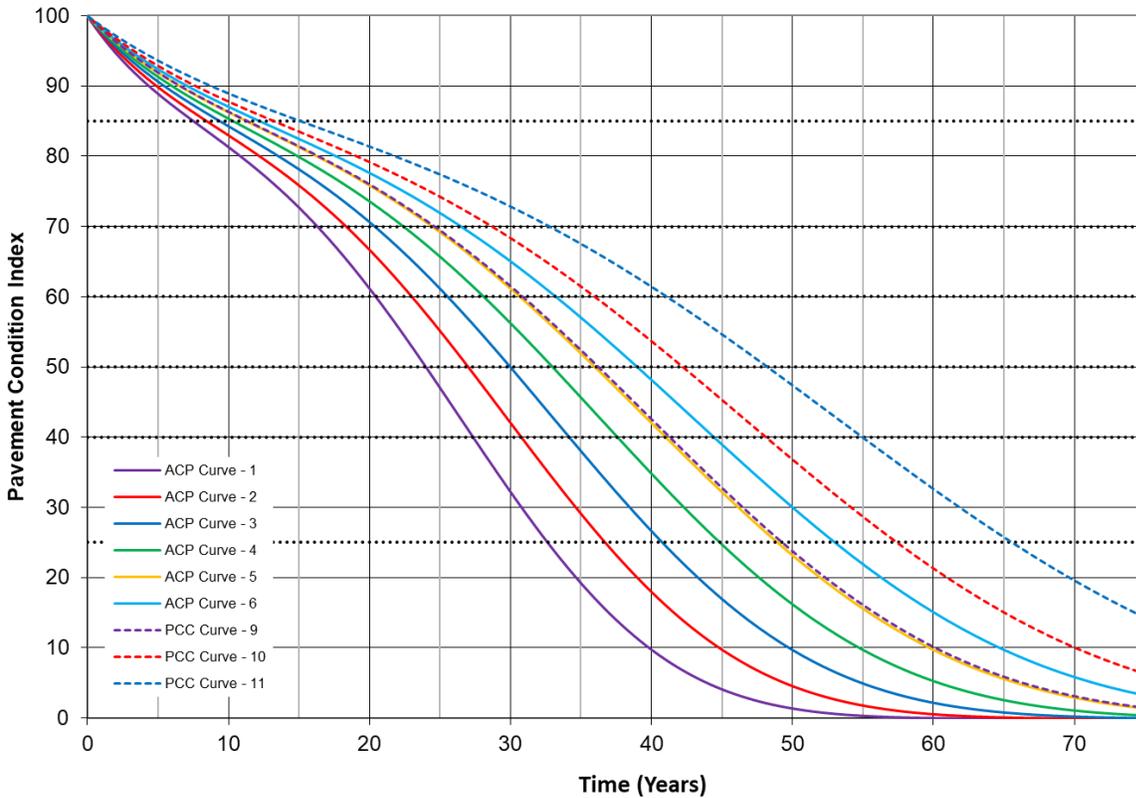

An accurate inventory of all City-owned streets is necessary to make any determinations, assumptions, or projections within a management system. The individual attributes about length, width, location, traffic use, surface type, condition, and other factors that may be tracked are all tied back to a single management segment within Lucy and given a unique ID within the program. The attributes stored here determine what types of rehabilitation activities can be applied, how the section is prioritized within the system, and allow for placement and sorting during reporting.

### Inspection Data

Lucy has the ability to use a blended condition index depending on the goals and requirements of the City which allows a custom reporting value to be built that is representative of aspects being considered to rank the condition of a pavement. The inputs for this index rely on inspection data from the field survey. In addition to the data collected for PCI, International Roughness Index (IRI) data was also used in Lucy. Details on the individual components of the inspection are available in section 2.5.

### Pavement Deterioration Modeling

Inspection data by itself is only able to represent conditions at the time of collection. Within Lucy there are customizable curves that predict the rate of pavement deterioration based on pavement functional class, pavement type, and strength rating. The guiding concept is that pavements with like uses and attributes will deteriorate at similar rates. As such, high volume asphalt arterials in weak structural conditions would be expected to deteriorate faster and are represented in **Figure 6** below with a purple line (ACP Curve – 1). On the opposite end of the spectrum, low volume concrete local streets would be expected to deteriorate slowly and are represented with a blue dashed line (PCC Curve – 11).

**Figure 6 - Pavement Deterioration Curves**

**Rehabilitation Work Selections & History**

Lucity uses a set of protocols that allow for activities to be assigned to PCI ranges based on filter criteria that give the City the ability to create detailed rehabilitation strategy sets for each functional class and pavement type according to the best practices determined for that pavement.

As planned rehabilitation work is completed a record of the work should be added to the pavement management system. This ensures that conditions are up to date for future selections and creates a repository of information to aid in planning.

**Prioritization**

Within Lucity the option is available to prioritize pavement projects for rehabilitation based on six main criteria: PCI, Cost of Deferral, Pavement Strength, Pavement Type, and Functional Class of a segment. Depending on the goals set forth at the beginning of the project these criteria can be weighted differently based on their definition to create an overall priority factor for a project. Additional details on these factors are available in section 4.2.

**Project planning**

The ability to plan work as needed allows the management program to better reflect the realities of a paving program. Certain constraints may be applied to funds that require their use within a certain year and activities relating to other assets may dictate the time and type of work to be performed. Lucity allows for predefined projects to be entered into the management plan to account for work that is

known. This ensures that the final outcome is consistent with overall city planning and accurately reflects current funding allocations.

In terms of pavement management efficiency, a program based on worst-first, that is starting at the lowest rated street and working up towards the highest, does not achieve an optimal expenditure of funds. Generally, under this scenario, agencies can not sufficiently fund pavement rehabilitation and lose ground despite injecting large amounts of capital into the network.

The preferred basis of rehabilitation candidate selection is to examine the cost of deferral of a street, against increased life expectancy.

### **Funding analysis**

The actual process of determining where and when to spend funds is a function of inputs mentioned in the section. Information from the street section inventory, condition survey, deterioration modeling, rehabilitation activity protocols, prioritization, and project planner are all assessed to predict the outcomes of funding scenarios. These can either be goal-based or budget-based. A more detailed description is available in Section 5.

### **Reporting**

Lucity has the ability to generate basic reports for common data requests through a set of predefined layouts. This allows for quick access to section condition summaries, inspection data, budget scenario summaries, and data charts. The GIS data used to generate this report is also linked to the section summary information to allow for quick and easy visualizations of the data if imported into a GIS utility.

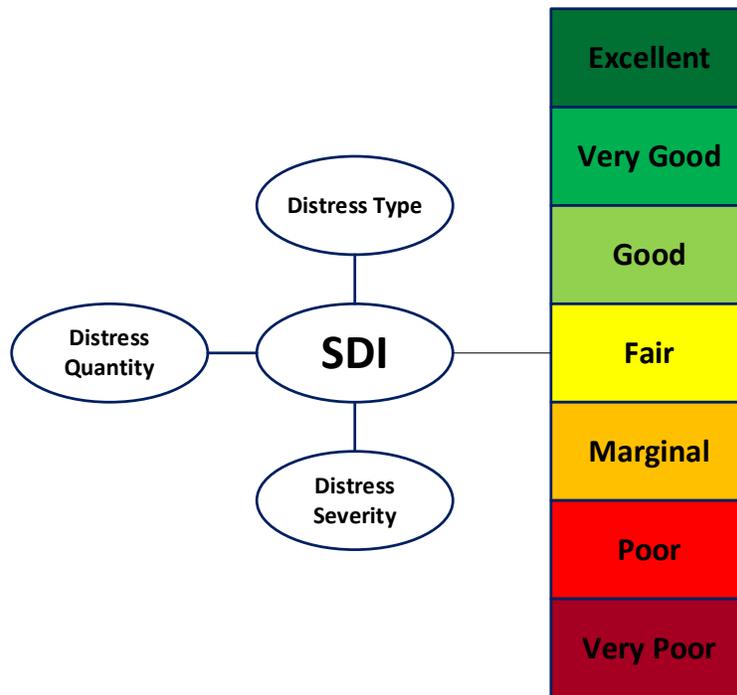

## **2.5. Pavement Condition Survey**

The goal of the pavement condition survey is to determine an accurate rating for each pavement section. The process of collecting and assessing data involves both automated and manual observations that originate from the data collected with the Road Surface Tester using Pavemetrics Laser Crack Measuring System (LCMS-2) downward imaging lasers, an array of 4k cameras, and trained rating personnel.

Within the “Network Analysis” tab in Lucity, IMS has populated values for a SDI, Roughness score, and Strength Rating. These three indices form the foundation on which Lucity operates.

### **Surface Distress Index (SDI)**

ASTM D6433 categorizes surface distress observations based on the extent and severity of distresses encountered along the length of the roadway for asphalt and concrete pavements. Presented on a 0 to 100 scale, the Surface Distress Index (SDI) is an aggregation of the observed pavement defects. However, not all surface distresses are weighted equally. Certain load-associated distresses (LAD) (caused by traffic loading), such as rutting or alligator cracking on asphalt streets, or divided slabs on concrete streets, have a much higher impact on the SDI than non-load associated distresses (NLAD) such as raveling or longitudinal and transverse cracking. Even at low extents and moderate severity (less than 10% of the total area), LAD can drop the SDI considerably. The rating systems also incorporates algorithms to correct for multiple or overlapping distresses within a segment to account for multiple distresses that may arise from a single cause. The SDI inputs are shown in **Figure 7**.

**Figure 7 - SDI Inputs and Detailed Scale**

ASTM D6433 covers nearly forty unique distress types that may or may not be present in an agency's road network. For that reason, IMS uses a modified approach that collects the most common and relevant distresses.

The descriptions on the following page outline some of the distresses collected for the City:

**Table 2 - Distress Descriptions**

**Alligator Cracking** – Quantified by the severity of the failure and square footage. This cracking is caused by the repeated bending a pavement experiences as vehicles pass over it. The cracks propagate from the bottom, meaning that structural failure has occurred. As a load-associated distress, it has a significant impact on the condition score, even at low extents.

**Rutting** – Starting at a minimum depth of ¼ inch, ruts are quantified by their depth and square footage. Rutting is caused by the permanent deformation of the pavement and/or subgrade layers. Low densities of rutting can have a large impact on the final condition score due to their implication of possible structural failure.

**Longitudinal & Transverse Cracking** –

Quantified by their length and width. These cracks can be the result of pavement shrinkage due to natural daily and seasonal temperature cycles, construction issues, or other factors.

**Block Cracking** – Quantified by their width and square footage, these cracks form interconnected longitudinal and transverse cracks that divide the pavement into approximately rectangular pieces. Block cracking is the result of aging and environmental factors.

**Patching** – Quantified by the square footage and severity of patches. Even a good quality patch is considered a surface defect and affects the ride quality and condition of a pavement.

**Raveling** – This is the loss of coarse aggregate on the pavement surface and is measured by the severity and square footage affected.

**Bleeding** – This is the presence of free asphalt binder on the roadway surface, which is caused by either an excess of asphalt in the pavement or insufficient voids in the matrix. The result is a pavement surface with reduced skid resistance. This distress is measured by severity and square footage.

**Edge Cracking** – Running parallel to the road and usually within 1 to 2 feet of the outer edge of the pavement, this distress is caused by traffic loading and weakened base conditions resulting from poor drainage. It is measured in linear feet.

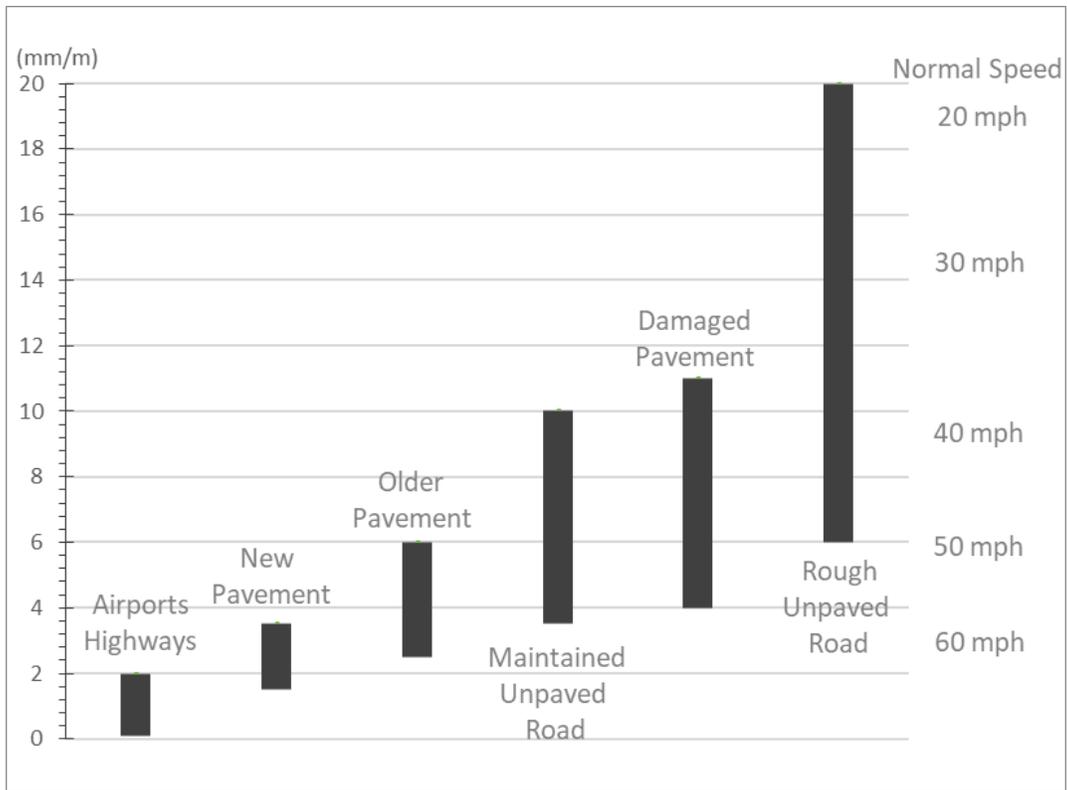

**Distortion** – This includes various localized unevenness in the surface of the pavement including bumps and sags, depressions, swell, corrugation, or shoving. This distress can be caused by a number of factors, including construction issues, subgrade failure, mixture failure, environmental influence, etc.

**Roughness Index (RI)**

The Roughness Index (RI) gives a measure of ride quality and is recorded following the industry-standard ASTM E1926 for determination of International Roughness Index (IRI). This value is generated from the longitudinal profile measured by the LCMS as it records the change in elevation over a distance. Once calculated it is expressed as a slope and reported in millimeters/meter (mm/m). Common IRI levels for new, older, and damaged pavements are displayed in **Figure 8**.

**Figure 8 - IRI Scale Definitions**

In order to align with the PCI scale so that a blended condition score can be formed, the IRI value is converted to a 0 to 100 score and reported as the Roughness Index (RI) as follows:

$$RI = (11 - 3.5 \times \ln(IRI)) \times 10$$

$\ln(IRI)$  is the natural logarithm of IRI.

For some context, a newer street would generally have an RI above 85, while one in need of an overlay would be in the range of 40 to 70. Roadways in poor condition typically have RI values below 40 but can achieve higher blended scores if the distresses causing the low RI score are not the result of structural failure or another severe cause. For example, hastened construction can result in a pavement surface with less than desirable smoothness, which would translate to a low RI value. But since the distress/imperfection is not due to severe failures within the pavement structure, the blended PCI value may not suffer greatly.

### **Structural Index (SI)**

Per the wishes of the City, the network of streets was not subjected to conventional structural testing, which is typically performed using a Falling Weight Deflectometer (FWD). However, the structural performance and capacity of the roadways still needed to be quantified to run pavement analysis. So, the relationship between the PCI and the amount of load-associated structural distresses was analyzed, and each pavement section was determined to have a Weak, Moderate, or Strong strength rating. The strength rating then translated to a Structural Index (30, 60, or 80 for weak, moderate, and strong respectively). It is important to note that these SI values were not used in determining the overall pavement condition score, as they were not calculated from true structural testing. These SI values were simply used to classify the pavement strength and aid in selecting appropriate rehabilitation strategies.

### **Pavement Condition Index (PCI)**

Following the field surveys, the condition data was imported to Lucity for calculating the overall PCI. The PCI for each network was calculated using the following weighing factor:

$$PCI = 100\% SDI$$

The following **Table 3** presents each PCI category along with a brief description of the typical distresses and treatments for each.

**Table 3 - Pavement Condition Categories**

Category	Typical Distresses and M&R Recommendations	PCI Range
Excellent	Like new condition – little to no maintenance required  Monitor condition or preventive maintenance.	(85-100]
Very Good	Minor cracking, raveling, and other non-load associated distress  Routine or preventive maintenance. <i>E.g., Crack sealing, surface treatment</i>	(70-85]
Good	Minor to moderate cracking and low severity load associated distresses such as alligator cracking and rutting.  Surface treatments with localized repairs and overlays <i>E.g., Surface treatments, localized surface patching, thin overlay</i>	(60-70]
Fair	More extensive and severe longitudinal and transverse cracking, as well as moderate severity load associated distresses  Localized repairs or major rehabilitation. <i>E.g., Localized surface and/or full-depth patching, moderate overlays</i>	(50-60]
Marginal	Localized high-severity alligator cracking, and rutting.  Major rehabilitation. <i>E.g., Localized full-depth patching, mill and overlay, traditional overlay</i>	(40-50]
Poor	A greater extent of severe alligator cracking, rutting  Major rehabilitation. <i>E.g., More extensive full-depth patching, mill and overlay, traditional overlay</i>	(25-40]
Very Poor	Extensive and severe alligator cracking, more extensive and deeper rutting, and potholes.  Major rehabilitation. <i>E.g., Full-depth reclamation, reconstruction</i>	[0-25]

## 2.6. Field Survey Methodology

IMS deployed one of its LCMS2 road surface testing vehicles to perform continuous sampling data collection activities as part of the semi-automated pavement condition survey. The LCMS2 equipment provides three-dimensional high-speed, mm-level scanning and pattern recognition analysis from two downward lasers mounted at the rear of the vehicle. This provides a higher level of detail in determining crack length and width measurement over the sample area. The LCMS2 device also operates as a Class I profile device that collects longitudinal profile (in the form of IRI) and transverse profile (rutting) using the advanced 3D profile laser scanning technology. The vehicle is also equipped with a high accuracy GPS device and several high definition 4k cameras that collect forward, downward, and rearward images.

**Figure 9 - LCMS2 data collection vehicle**

While the LCMS2 automatically collects the majority of visible distresses, the RST platform integrates highly trained IMS technicians to input additional changes in observed distress severities and extents or identify specific roadway assets or attributes such as curb reveal or lip of gutter information by means of a touchscreen-based tablet computer connected to the data flow through time code, GPS, DMI distance and inventory control. The data is then processed in the IMS office to generate extent quantities for each observed distress severity level which are then used to calculate a PCI.

## 2.7. Data Quality Assurance

The final step in determining PCI scores requires the field data to be subject to multiple stages of quality checks. The first phase is a rule-based check that flags roads based on expected outcomes from the automatic crack detection and processing parameters used to convert the LCMS2 data into severity and extent data. Part of this output is the identification of areas that are within the sample area but should be excluded from the assessment. This can include the edge of pavement or curb (purple and green highlight), manhole covers and inlets (red box), and pavement markings (yellow highlight) as seen in **Figure 10**. This is combined with information from our field raters about distresses that may not be present in a traditional manner or may be outside the guidelines set forth in ASTM D6433.

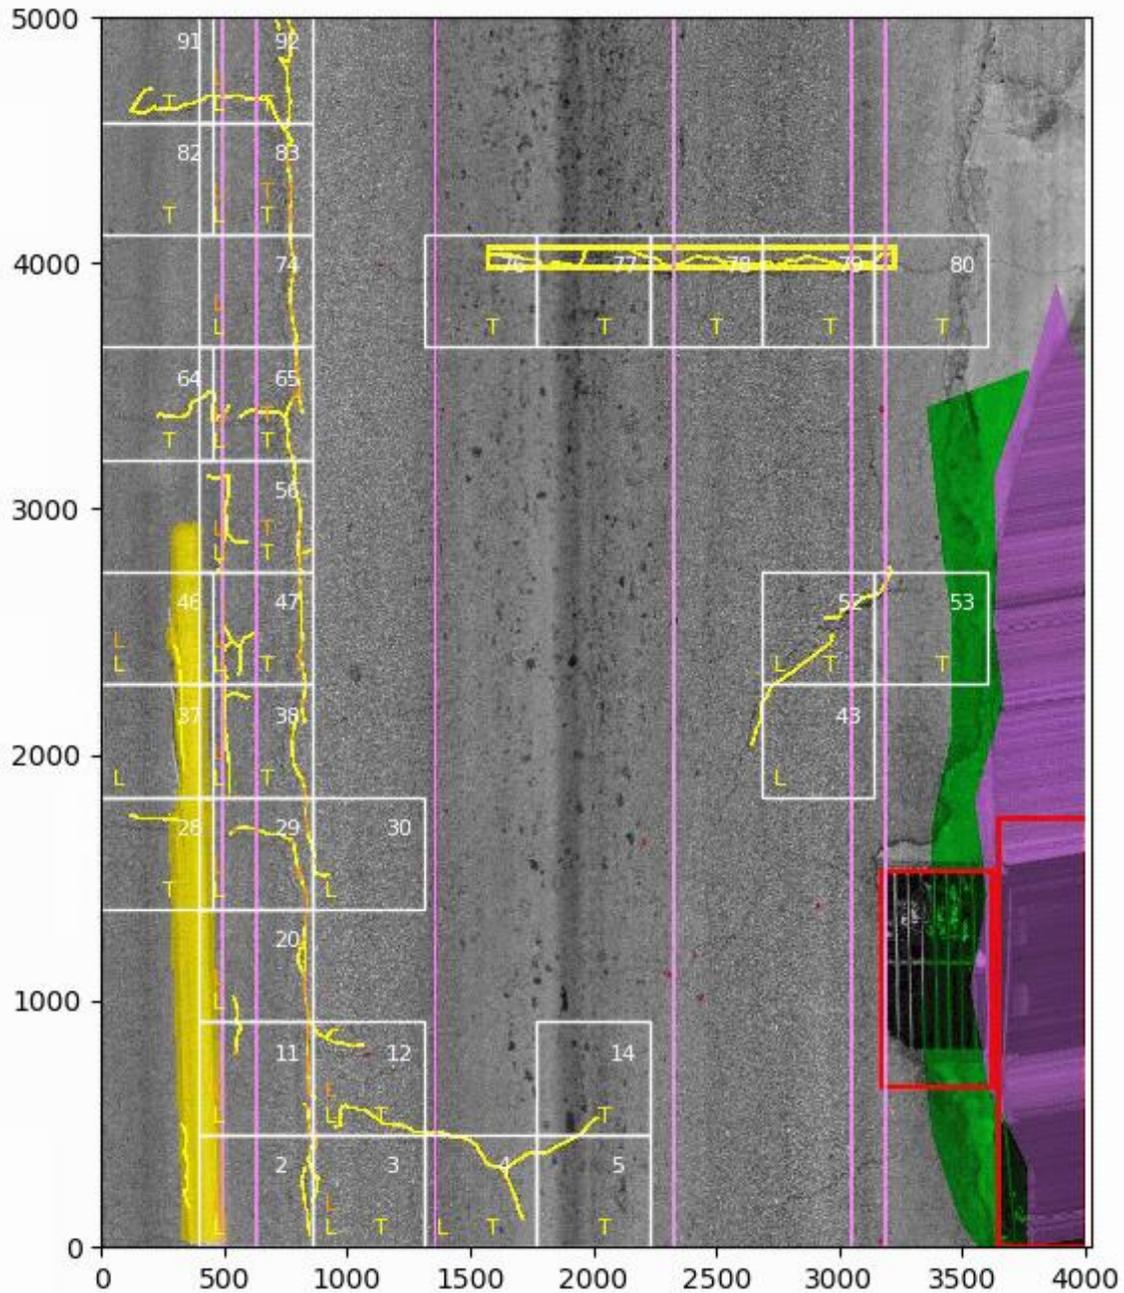

Figure 10 - Processed LCMS2 Image

A second review is then performed by a team of raters who are well-versed in both the distress standards and the data in its digital format. Using the downward laser scans, field notes, and 4K images collected from the survey the Quality Control (QC) team is able to verify the accuracy of what the LCMS has collected and what was flagged in the field.

Figure 11 - QC Image

To further ensure accurate condition data, spot checks are conducted on a network-wide basis by the QC team and the engineering staff. Once confidence in the integrity of the data has been achieved, an initial condition sheet is submitted for review by City staff.

## 2.8. Summary

This section outlined the fundamental concepts of pavement management and the process by which the pavement management system was implemented for the City. The operating parameters of Lucity were reviewed, and the inputs provided by the LCMS-2 technology were explained to provide context for PCI, Roughness Index, and Pavement Strength.

## 3.0 PAVEMENT CONDITION SURVEY RESULTS

### 3.1. Foreword

This section will review the results of the pavement condition survey performed in April 2022. First is a summary of conditions in the three functional classes used in the City’s analysis. Next, this section will review photos of the network taken from the RST. Finally, a series of charts will summarize the findings of the condition survey and the overall PCI distribution of the City pavement network.

### 3.2. City Street Inventory and Condition Summary

The City of Bloomington is currently responsible for approximately 237 centerline miles of pavement with an overall PCI of 51 and a backlog of 42%. **Table 4** presents the City’s inventory and pavement condition breakdown between different functional classes. Detailed information for each management section is available in **Appendix A**.

**Table 4 - Network Inventory Summary by Functional Class and Pavement Type**

	Pavetype	Network	Arterial	Collector	Residential
Segment (Block) Count	All Streets	2881	507	516	1858
	HMA	2854	487	516	1851
	PCC	27	20	0	7
Network Length (ft) (Centerline Length)	All Streets	1,250,010	259,792	253,676	736,542
	HMA	1,240,467	251,565	253,676	735,226
	PCC	9,543	8,227	0	1,316
Network Length (mi) (Centerline Length)	All Streets	236.7	49.2	48.0	139.5
	HMA	234.9	47.6	48.0	139.2
	PCC	1.8	1.6	0.0	0.2
Average Width (ft)	All Streets	26.4	32.7	26.3	24.2
	HMA	26.3	32.7	26.3	24.2
	PCC	31.3	31.8	0.0	28.4
Network Area (yd <sup>2</sup> )	All Streets	3,662,875	943,451	740,327	1,979,097
	HMA	3,629,699	914,422	740,327	1,974,950
	PCC	33,175	29,029	0	4,147
Current PCI March 2023	All Streets	52	56	54	49
	HMA	52	55	54	49
	PCC	87	90	0	65
Current Backlog (mi)	All Streets	97.1	17.7	18.9	60.5
Current Backlog (%)	All Streets	40.6	Percentage of Network with a PCI < 40		

### 3.3. City Network Condition Imagery

The images presented below provide a sampling of the City's streets that fall into the various condition categories with a discussion of potential rehabilitation strategies.

#### Very Poor (PCI = 0 to 25) – Complete Reconstruction

**West 16<sup>th</sup> Street from North Hancock Drive to North Monroe Street (GISID 2353, PCI = 6)** – Rated as Very Poor, this street displays a large quantity of alligator cracking and rutting, severe enough to suggest that the pavement structure is inadequate for current traffic loads. Additionally, there is a significant amount of rutting and potholes along the right-hand side of the street. The rehabilitation of roads in this condition through a mill and overlay is generally ineffective, as the failures usually extend to the bottom of the pavement layer. Streets in this condition require rehabilitation that involves removal and replacement of the asphalt layer, base stabilization, or complete reconstruction based on design requirements.

Deferral of reconstruction of streets rated as Very Poor will not cause a substantial decrease in overall pavement quality. The streets have passed the opportunity for overlay-based strategies, meaning that reconstruction, which is expensive, is the most suitable solution. So, Very Poor streets are often deferred in favor of rehabilitating more streets at lower costs, resulting in a greater net benefit to the City. This strategy however must be sensitive to citizen complaints forcing the street to be selected earlier. In addition, this type of street can pose a safety hazard for motorists since severe potholes and distortions may develop. It is important to consistently monitor these streets and check for potholes or other structural deficiencies until the street is eventually rebuilt.

## Poor (PCI = 25 to 40) – Last Opportunity for Surface Base Rehabilitation

**West 6<sup>th</sup> Street from North Madison Street to B-Line Trail (GISID 1711, PCI = 29)** – Rated as Poor, this segment still has some remaining life before it becomes a critical reconstruction need. As evident in the imagery, a fair amount of the segment displays severe alligator and block cracking. If left untreated, within a short period of time, a partial to full reconstruction would be required.

On heavily trafficked roadways, Poor streets often require partial to full reconstruction. On local roadways, they require removal of the pavement surface through grinding or excavation, base repairs, restoration of the curb line and drainage, and then placement of a new surface.

## Marginal (PCI = 40 to 50) – Thicker Overlays

**East Longview Avenue from North Lexington Drive to North Concord Road (GISID 5737, PCI = 44)** – On this street, the primary cause of deterioration is the alligator cracking along the left edge of the pavement. Additionally, transverse cracking is seen throughout the segment.

Marginal streets that display high amounts of load associated distresses (LAD) are selected as a high priority for rehabilitation as they generally provide the best cost/benefit ratio to the City. If left untreated, Marginal streets with high amounts of LAD will deteriorate to become partial reconstruction candidates. Marginal streets that are failing due to materials issues or non-load associated failures may become suitable candidates for thick overlays if deferred, without a significant cost increase.

## Fair (PCI = 50 to 60) – Thin to Moderate Overlays

**East Longview Avenue from South Williamsburg Drive to South Pete Ellis Drive (GISID 3886, PCI = 54) –** Fair streets have similar characteristics to Marginal streets in that the distresses present tend to be localized and moderate in severity. On this segment the primary cause of deterioration is the isolated alligator cracking, which can be seen in the center of the image above. This distress has not spread throughout the segment and should be addressed by means of structural patching to fix any underlying base conditions.

Like Marginal streets, Fair streets can provide a good cost/benefit ratio to an agency if addressed with an adequate rehabilitation technique. Stretching the application for surface treatments into this range can pose a cheap alternative to overlays but does not provide the appropriate renewal to the structural capacity of the pavement and may allow load related deterioration to continue unabated.

## Good (PCI = 60 to 70) – Surface Treatments

**East Maxwell Lane from South Greenwood Avenue to South High Street (GISID 1303, PCI = 66)** – Rated as Good, the primary cause of deterioration is the longitudinal and transverse cracking, which has been mostly sealed. The pavement surface could be restored further with additional spot patching to fully waterproof the pavement.

Preventive measures on streets considered “Good” can have a positive impact of the City’s funding needs. While the expected life of a slurry seal is not as long as that of an overlay, its ability to slow deterioration and relative low cost can free up funding for streets in worse condition.

## Very Good (PCI = 70 to 85) – Surface Treatments and Localized Rehabilitation

**West 17<sup>th</sup> Street from West Arlington Road to North Lindbergh Drive (GISID 8051, PCI = 78)** – Rated as Very Good, this road displays minor amounts of transverse cracking and raveling. This street is an example of a candidate for preventative maintenance such as microsurfacing to extend the life of the roadway.

Routine maintenance prevents water intrusion by sealing and slowing crack growth. By keeping water out of the base layers, the pavement life is extended without the need for heavier rehabilitations.

**Excellent (PCI = 85 to 100)**

**East Olcott Boulevard from South Dale Court to South Daniel Street (GISID 1950, PCI = 98)** – Rated as Excellent, this pavement displays little to no surface distresses. The ride is smooth, and the surface and the base are intact. Excellent roads should be periodically assessed for crack development that would trigger routine maintenance activities.

### 3.4. City Network Condition Distribution

Figure 12 shows the distribution of pavement condition for the roadway network in Bloomington.

- Thirteen percent (13%) of the network can be considered in “Excellent” condition and should be closely monitored to ensure timely application of early localized preventive measures.
- Fourteen percent (14%) of the network falls into the PCI range considered “Very Good”. These are roads that benefit most from preventative maintenance techniques such as spot patching and slurry seals.
- Four percent (4%) of the streets are rated as “Good” and may still be candidates for slurry seals or thin overlays.
- Twenty-eight percent (28%) of the network can be considered in “Fair” to “Marginal” condition and represent candidates for progressively thicker overlay-based rehabilitation. If left untreated, they will decline rapidly into reconstruction candidates.
- The remaining forty-one percent (41%) of the network is rated as “Poor” or “Very Poor”, meaning these roadways have deteriorated to the point where surface rehabilitation can no longer restore the pavement to a point of structural adequacy. Rehabilitation of the entire pavement structure is required for these segments.

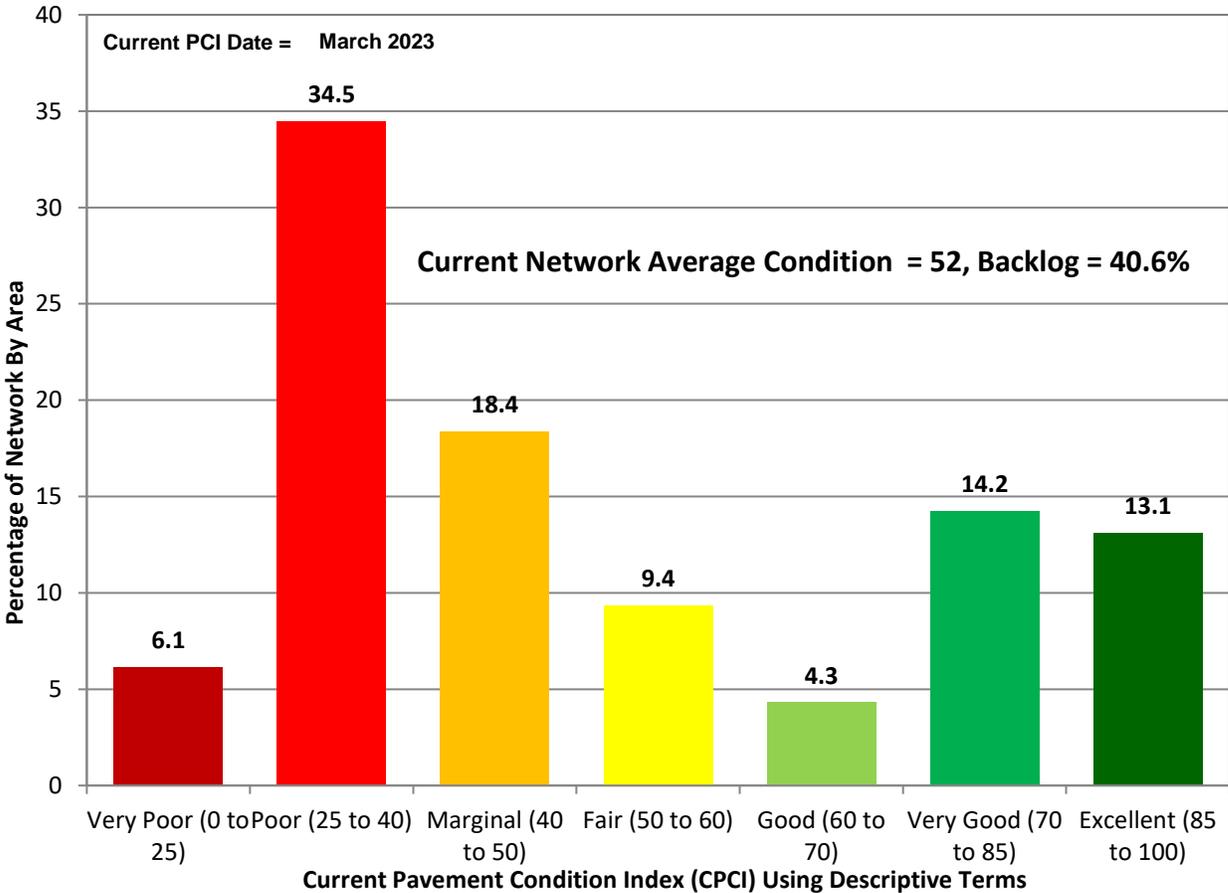

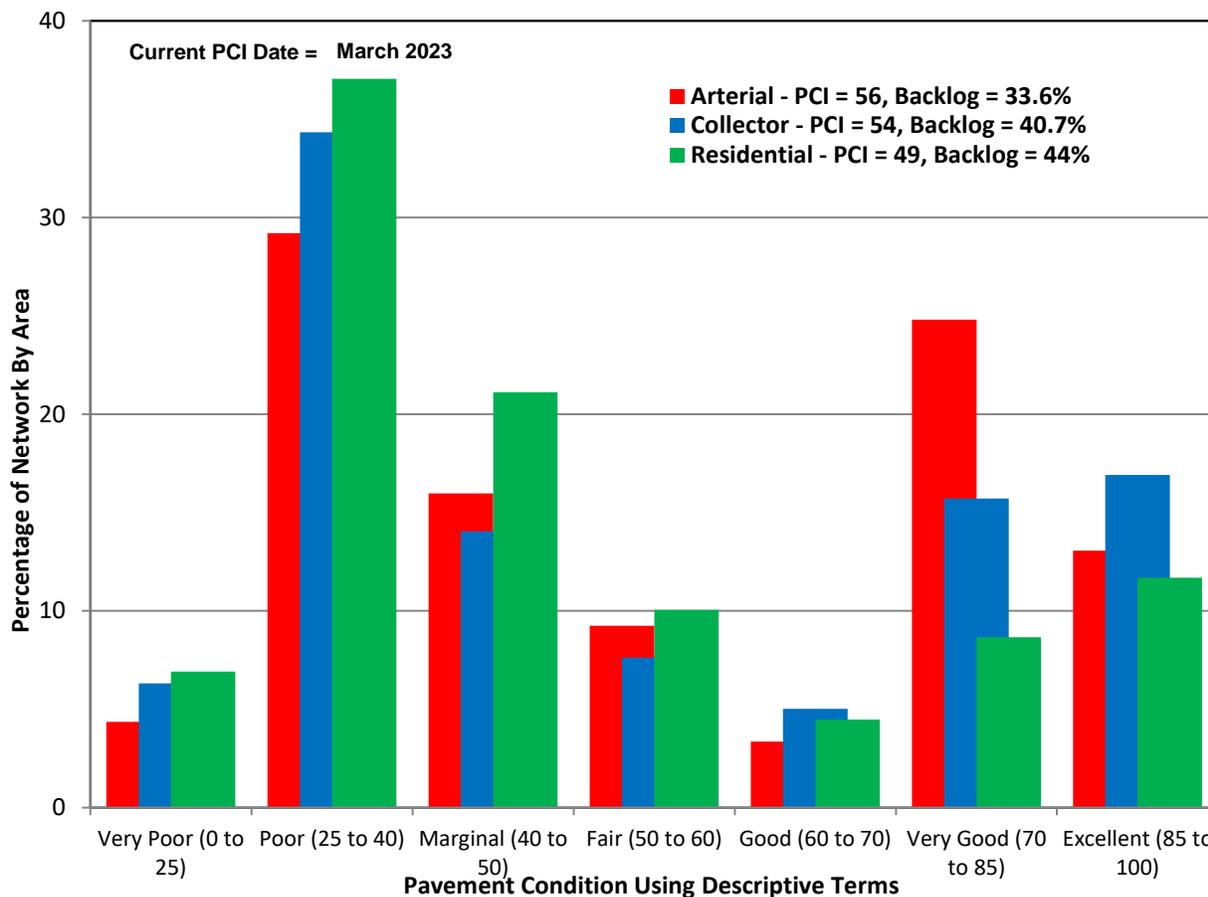

Figure 12 - Roadway Network Present Status Using Descriptive Terms

### 3.5. Condition By Functional Classification

When assessing the overall condition of the network, there are additional subsets of data that can give a deeper insight into where an agency may want to focus resources. **Figure 13** highlights the pavement condition distribution for each functional class. It is important to note that arterial roadways, which are the streets that support the greatest traffic volumes in a given timeframe, should receive additional consideration when selecting rehabilitation candidates.

**Figure 13 - Condition Rating by Functional Classification**

### 3.6. Structural and Load Associated Distress Analysis

As mentioned in section 2, pavement distresses may be categorized into two classifications – load associated distresses (LAD) and non-load associated distresses (NLAD). Load associated distresses, such as rutting and alligator cracking, are those that are directly caused by traffic loading and lead to decreased structural capacity. Non-load associated distresses are those that result from material or environmental issues, including shrinkage (transverse) cracking, bleeding, and raveling. Generally, load associated distresses affect the overall condition score more than non-load associated distresses due to their implications of structural failure. The roadways were classified as Weak, Moderate, or Strong depending on the type of distresses found on their surfaces. The strength rating then translated to a Structural Index (30, 60, or 80 for weak, moderate, and strong respectively).

## 4.0 REHABILITATION PLAN AND BUDGET DEVELOPMENT

### 4.1. Foreword

This section discusses the results of the pavement management analysis that was performed using the Lucity pavement management system. First is an overview of the assumptions that were used when implementing the system. Some of these include the development of accurate unit rates, and the selection methodology for rehabilitation candidates. Next, in 4.3, the results of each of the various budget runs is detailed, along with their predicted conditions. This is highlighted further through a series of charts that are used to demonstrate the advantages and disadvantages of various funding models.

### 4.2. Key Analysis Set Points and Assumptions

Pavement management analysis requires user inputs to complete its condition forecasting and prioritization. A series of operating parameters were developed to create an efficient program that is tailored to the City's needs.

#### Selecting Segments for Rehabilitation

The selection of rehabilitation candidates through a worst first approach or subjective committee input is neither efficient nor cost effective. A series of criteria must be established and their importance in the selection process determined. Lucity has defined commonly used criteria within the program that allows different weighting factors to be applied depending on the City's goals.

- **PCI** – As mentioned earlier in this section the results of the pavement condition survey are used to generate a Pavement Condition Index that ranges from 0-100 where 0 is considered the worst and 100 the best. This factor can be given a higher weight to give greater priority to poor condition streets.
- **Cost of Deferral** – As time passes a pavement will deteriorate and require more costly repairs as it ages. Lucity can be configured to prioritize streets nearing the point where this cost increase occurs.
- **Pavement Strength** – Through the use of deflection testing or the prevalence of load associated distresses the relative strength of a pavement can be determined. A prioritization factor can be applied that gives preference to streets that may deteriorate faster in order to apply more cost-effective rehabilitation early in the life cycle.
- **Pavement Type** – Depending on costs, design life, and the City's goals, a weighting factor can be applied based on the materials used in construction.
- **Functional Class** – Generally higher volume streets are given the greatest priority within a program since they serve the most vehicles.

For the City, weighting factors for these categories were set to maximize the savings from the concept of cost of deferral and address lower PCI 'Weak' streets in order to minimize backlog growth.

#### Rehabilitation Strategies and Unit Rates

The rehabilitation strategies and unit rates used in the budget analysis are the driving factors in determining funding requirements for the City. A detailed listing of how each rehabilitation activity is applied and its associated cost can be found in **Table 5**. Some important parameters include:

- **Rehab Activity** – The assigned identifier and name to each rehabilitation strategy. Various degrees of slurry sealing are outlined to highlight the increasing cost associated with additional patching requirements for lower PCI streets.
- **Min, Max, and Critical PCI** – These values compose the PCI range for which a particular rehabilitation activity can be applied where the Min and Max values define the upper and lower limit, and the Critical PCI is the point at which the rehabilitation becomes a higher priority to take advantage of the cost of deferral factor. Overlap in the PCI range allows for additional rehabilitation differentiation based on pavement strength.
- **Unit Rates** – The rehab costs are presented on a per square yard basis for each pavement type, functional class, and rehabilitation activity combination. A base unit rate is established for the lowest assumed cost for a work type and adjusted for each functional class depending on the additional work that may be required for traffic control, intersection improvements, landscaping, utility adjustments, and right-of-way (ROW) infrastructure. IMS worked closely with the City to determine rates that accurately represent the cost of work.

**Table 5 - Rehabilitation Rates**

Pavement Type	Rehab Code	Rehab Activity	Min PCI	Critical PCI (Need Year)	Max PCI	Rehab Funding Sequence	Arterial Unit Rates (\$/yd2)	Collector Unit Rates (\$/yd2)	Residential Unit Rates (\$/yd2)

### 4.3. Network Budget Analysis Models

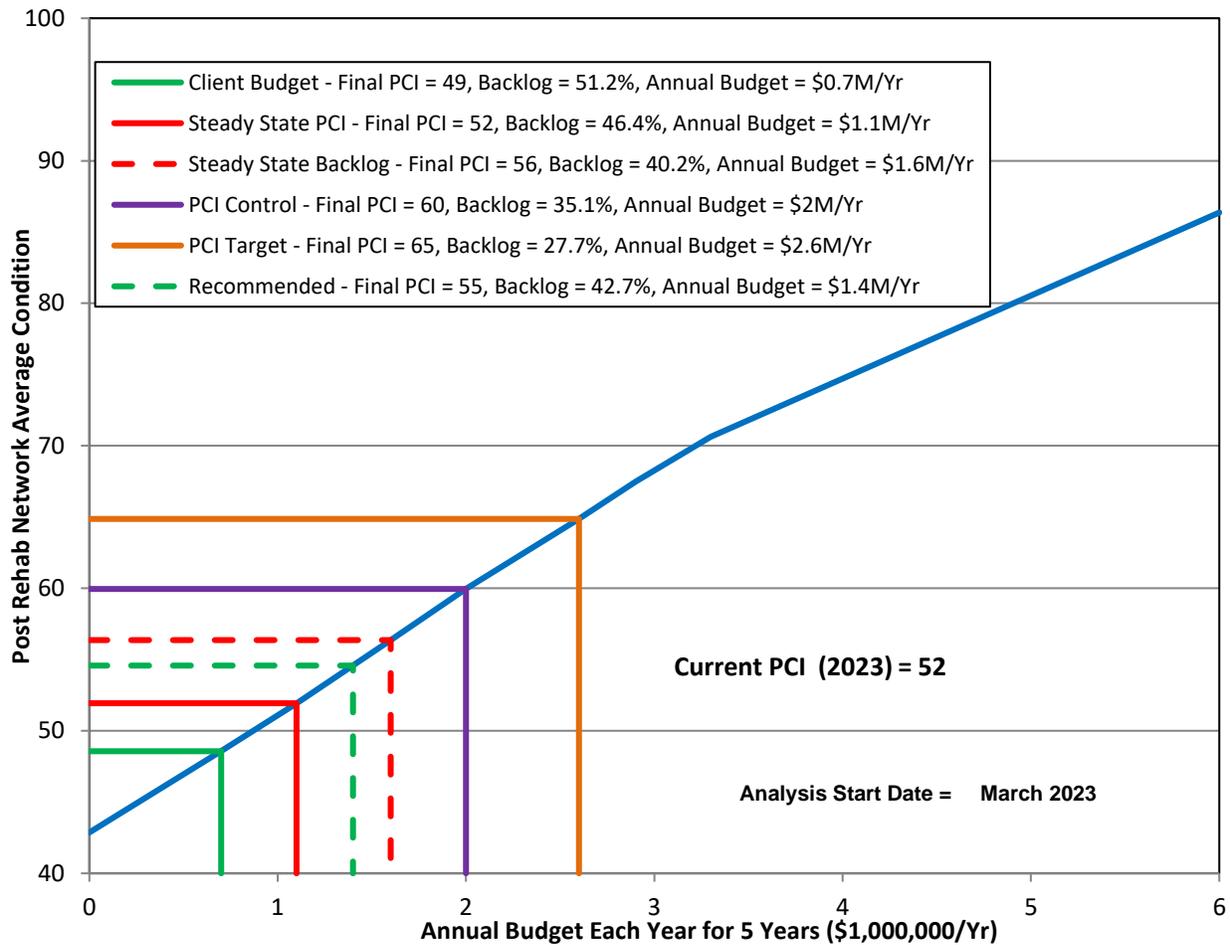

By combining the condition assessment, deterioration model, prioritization factors, and rehabilitation assignments, the Lucity program can determine the outcomes of various funding levels or suggest the funds required to attain a goal. IMS ran a series of budgets to model network trends and estimate the funding levels needed to reach certain condition and distribution targets. The results of this analysis are outlined in this section.

#### Budget Targets

The following scenarios were generated to forecast the outcomes of the current estimated City budget over the next five years and determine what level of funding may be appropriate going forward. The values for backlog and PCI have been rounded to the nearest whole number in order for the figures to be more legible. Varying budget figures will have slightly different outcomes that are visible in the charts but may not be completely represented in the legend text.

- **Bloomington Budget** (Green Line) – This represents the City’s current average annual budget of **\$700K/Yr.** dedicated to pavement preservation and rehabilitation. This level of funding will result in a network average PCI score of **49** and a backlog of **51%** after five years. Additionally, this budget was extrapolated out in a 5-year model that can be seen in **Figure 18**.
- **Recommended Funding** (Green Dashed Line) – The recommended level of funding attempts to reach a balance between the quickly growing backlog and declining average PCI. A funding level of **\$1.4M/Yr** is recommended to achieve a PCI of **55** with a backlog of **43%**.
- **Steady State PCI** (Red Line) – This is simply the funds required to maintain the current network average PCI at **52**. The annual budget required to do so is approximately **\$1.1M/Yr**. Backlog will grow to **46%** of the network after five years.
- **Steady State Backlog** (Red Dashed Line) – The Steady State Backlog budget was developed in order to maintain the current backlog of **40%**. This results in a budget value of **\$1.6M/Yr.** and a PCI increase to **56** after five years.
- **PCI Control** (Purple Line) – The PCI Control budget was developed in order to achieve a PCI of **60**. The funding required to achieve this PCI goal is **\$2M/Yr** and will also reduce the backlog to **35%**.
- **PCI Target** (Orange Line) – The PCI Target budget determines the minimum level of investment in order to achieve a PCI of **65**. This budget is on the order of **\$2.6M/Yr** and will result in a backlog of **28%**.

The results of the analysis are summarized in **Figure 15**. The X-axis highlights the annual budget, while the Y-axis plots the 5 Year Post Rehab Network Average PCI value. The diagonal blue line is the network trend model developed to show estimated PCI along with a funding range up to \$6M/Yr.

**Figure 15 – 5-Year Post Rehab Network PCI Analysis Results**

Figure 16 presents the resultant network backlog against the annual budget. It is similar to Figure 15, but instead of plotting the average PCI score, the blue diagonal line represents the total backlog after 5 years. The City currently maintains a backlog of 41%. While some growth is acceptable, every effort should be made to keep that value as low as possible. As the backlog grows, the funding required to return to the current level will increase considerably.

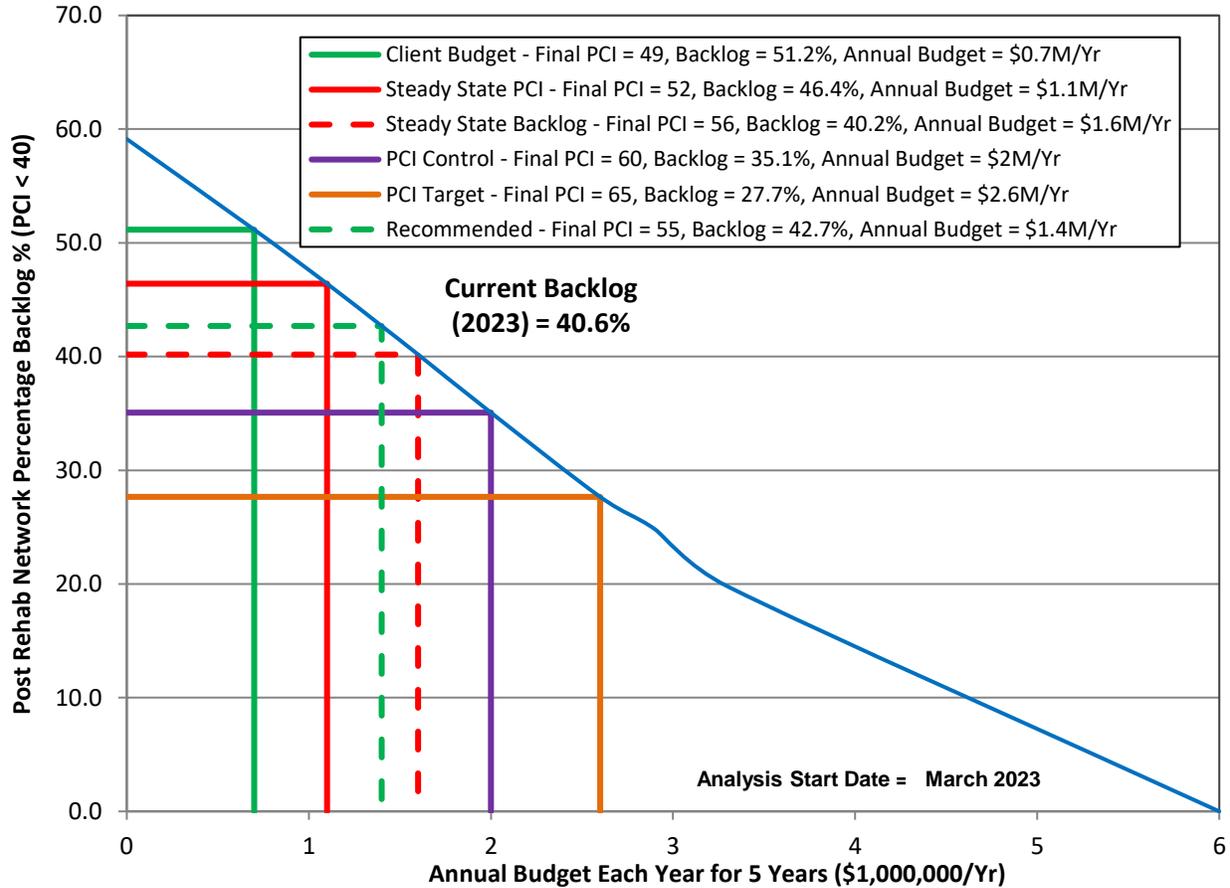

Figure 16 – 5-Year Post Rehab Network Backlog Results

Figure 17 presents the analysis results on an annual basis. This shows that if the budget falls below \$1.6M/Yr. (Steady State PCI Budget), over time the overall condition of the roads will deteriorate as the backlog continues to grow.

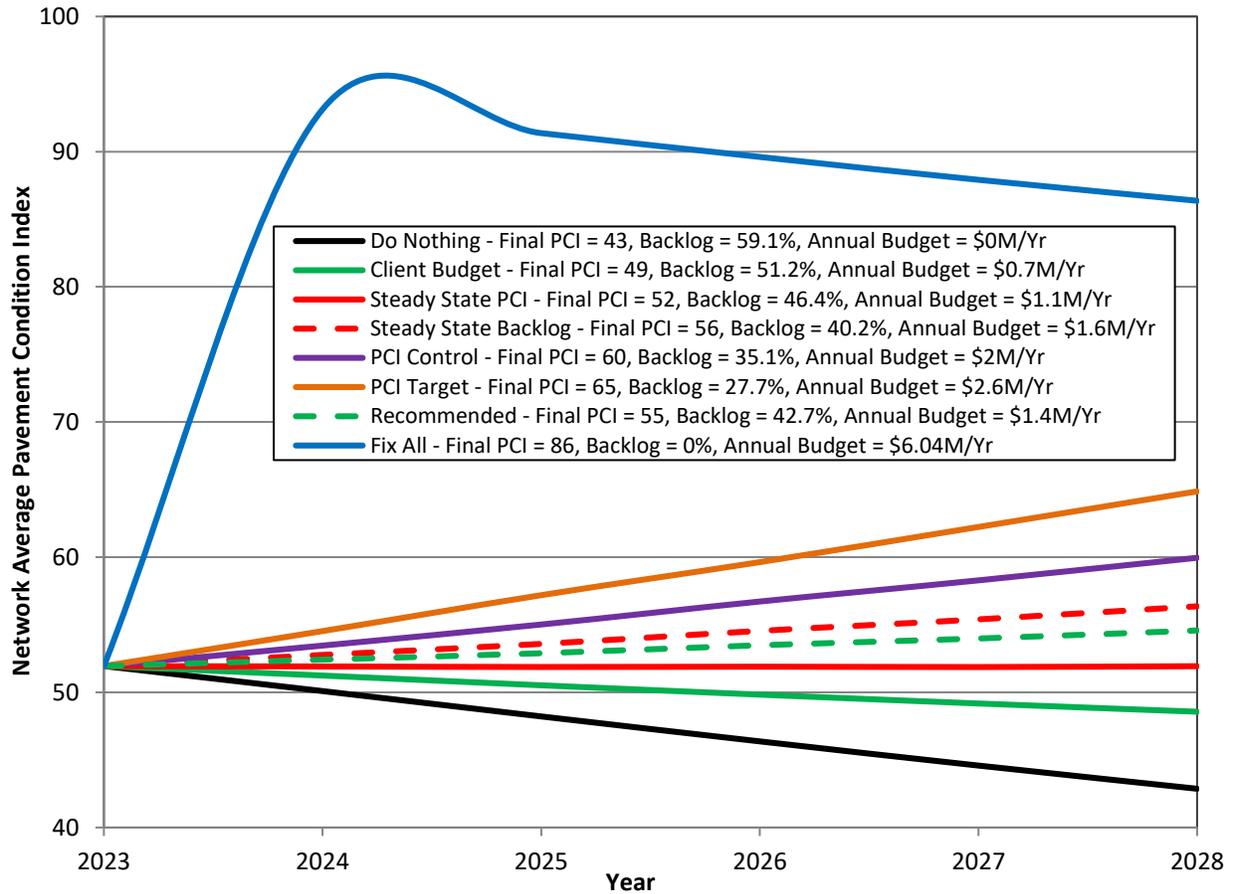

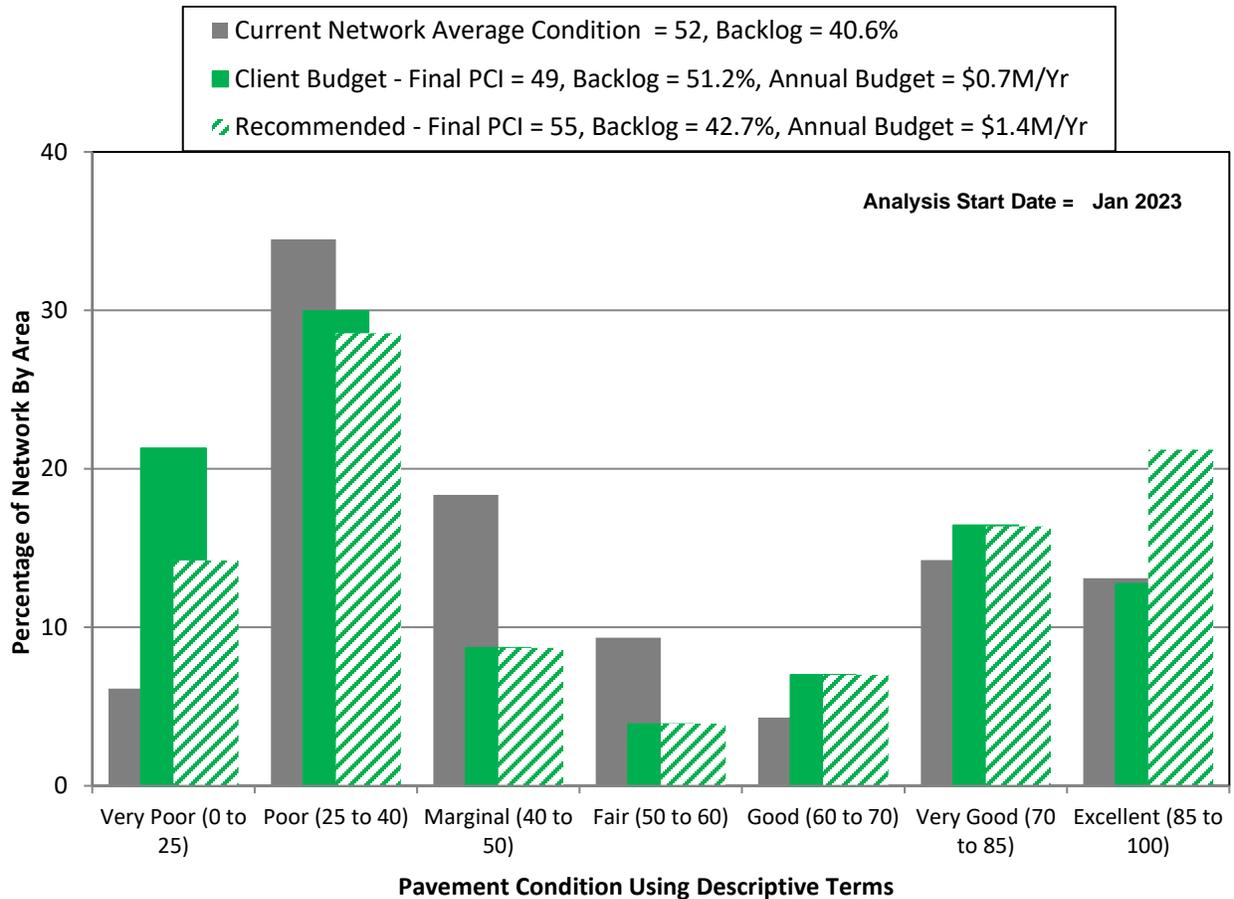

Figure 17 – 5-Year Annual PCI

#### 4.4. Post Rehabilitation Condition

The following figure (**Figure 18**) compares the current network condition distribution (gray) against the projected 5-year (green) post rehabilitation distribution at the current estimated \$700K/Yr. funding level. Based on current models, the average PCI is expected to decrease to 52 by the end of the five-year analysis period and the backlog to increase to approximately 41%.

**Figure 18 – PCI Distribution Comparison - Current Conditions VS 5th Year Post Rehabilitation**

#### 4.5. Summary

This section reviewed the results of the 2022 pavement analysis models that were run in the Lucity program. The current City budget of \$700K/Yr will result in a 5-year post rehab PCI of 49 and a backlog of approximately 51%. These models demonstrate that a budget that falls below \$1.4M/Yr (steady state PCI model) will result in an overall PCI decrease over the course of 5-years.

## 5.0 PROJECT RECOMMENDATIONS AND COMMENTS

### 5.1. Project Summary and Recommendations

A pavement condition survey was performed in April 2022 on the full City pavement network. The results of the condition survey were aggregated into the Lucity pavement management system. This system was used to organize a georeferenced pavement inventory, develop an accurate model of the network's condition and anticipated deterioration, and provide funding recommendations for various level-of-service goals.

The following broad recommendations are presented to the City as an output from the pavement analysis and must be read in conjunction with the previous sections.

- The City should make efforts to keep the Lucity software up to date.
  - By maintaining and updating the rehabilitation unit rates, work history of the segments, and accuracy of the inventory the City will be able to reliably forecast funding needs for future years. This allows the City to be proactive in maintaining the condition of the pavement network at an acceptable level.
- The City should periodically resurvey the pavement network.
  - Pavement performance over time involves many variables, such as traffic volumes, environmental factors, maintenance timing, and design standards. As these variables change, the rate at which a pavement deteriorates will change with them. The periodic resurvey of pavement conditions allows the City to track these changes and update models accordingly to ensure that appropriate rehabilitation measures are being planned.
- The City should investigate new and additional rehabilitation activities.
  - As technology progresses, improvements in pavement rehabilitation are constantly being made. When possible, the City should refresh the rehabilitation activities planned in Lucity to ensure these advances are used to the City's advantage.
- The City should strive to maintain or better its current condition if possible.
  - Generally, it is more cost effective to maintain a condition than it is to regain ground lost to deterioration. The City currently maintains an overall network PCI of 52 with a backlog value of 41%. The current annual budget of \$700K will result in a PCI of 49 and a backlog of 51%. To curb the increasing backlog and enhance the overall pavement conditions, the City should consider increasing its annual budget to approximately \$1.4M. This additional spending is projected to lead to a PCI of 55 and a backlog of 43% in five years.

### 5.2. Closing

The IMS Team greatly appreciates the opportunity to work with the City on this pavement management update. Over the course of this project, it has become clear that the City staff demonstrates a strong commitment to providing the highest level of service that they can to their community. IMS stands ready to assist the City with training and technical support as necessary, and we welcome the opportunity to work with the City on future pavement management projects.
